

Why should you upgrade?

Reason 1

Improved Accuracy

Dragon 11 significantly improved recognition accuracy and can reduce recognition errors up to 15% compared with Dragon 10. This means Dragon 11 recognises speech more accurately right out of the box so users will spend less time correcting recognition errors.

Reason 2

Faster Response Times

Dragon 11 has improved recognition response time significantly. It is also faster than previous editions when selecting application menu items by voice or executing voice commands that perform actions within applications (e.g., "insert page break," "make that red," etc.)

Reason 3

New Dragon Sidebar

A major enhancement over version 10's 'Sample Commands' window, this new desktop assistant allows users to discover and remember many commands and tips; at any time, it lets you glance at or explore global commands (including mouse commands), application-specific commands and custom-created commands, as well as tips. The Dragon Sidebar is a thin, resizable and dockable window that can be placed anywhere on the Windows desktop. Its contents change depending on what window is currently active. In addition, the Sidebar lets users print its content.

Reason 4

More usable toolbar (the DragonBar)

The naming and organisation of items on the DragonBar now allow users to discover and quickly access important but often-overlooked Dragon features, such as the Vocabulary Editor, the analysis of specific documents, scheduled tasks, and recognition modes (Dictation Mode, Numbers Mode, etc.). Now docked to the top of the screen by default, the DragonBar gathers in one area all its indicators: icons and written messages.

Reason 5

Improved Correcting and Editing

Now when users issue voice commands to select, correct, edit or format a word or phrase and there are multiple matches for what they said in their document, Dragon displays a number next to each match. Users can then choose whether to apply the command to one or all of the numbered items, so they save time by directly addressing a specific spot or addressing multiple spots all at once. This also applies to the commands "delete...", "copy...", "insert before...", and more.

Reason 6

Dragon Learns from all Corrections

In the past, corrections entered using the keyboard were not incorporated into the user profile. Now when a user dictates something and retypes it to correct a misrecognition, Dragon identifies this as a correction and uses it to adapt the user's profile, improving its accuracy over time.

Reason 7

Time-Saving Voice Commands

New commands enable users to effortlessly switch to a specific window (Dragon displays a numbered list so the user can just say the number of the desired window.) In addition, Dragon 11 allows shorter names for starting popular applications (e.g., "Start Microsoft Word" instead of "Start Microsoft Office Word 2007").

Reason 8

Office 2010 support

Dragon 11 is compatible with Microsoft Office 2010 applications. Full Text Control, Menu Tracking and Natural Language Commands are supported for Word 2010, Outlook 2010 and Excel 2010 allowing users to take full advantage of Dragon dictation and commands in these new applications.

Reason 9

Improved Text-To-Speech Playback

Smoother fast-forward and rewind behaviours are now available and users now have options to control speed and volume.

From improved accuracy and faster performance, to an intuitive user interface with a rich Help system, powerful new voice commands and an enhanced correction and adaptation process, Dragon NaturallySpeaking 11 has been redesigned to be...
FASTER, BETTER and SMARTER.
